HeySig — Small Hearing Aids. Smart Technology. Better Control.

Modern convenience for compatible Signia hearing aids that communicate acoustically, without built-in Bluetooth.

Why HeySig?

Small, discreet hearing aids can be more comfortable to wear, but models without Bluetooth may lack conveniences available in larger connected devices. HeySig aims to close that gap by putting more of the intelligence and control in an Android phone and compatible smartwatch—not inside the hearing aids.

Your Phone and Watch Provide the Intelligence

HeySig uses the phone's processing power and microphones for listening-environment awareness, while phone and watch interfaces provide convenient ways to adjust supported hearing aid settings. Compatible Signia hearing aids continue to receive commands through their existing acoustic communication method.

Automatic Listening Adjustments

HeySig is designed to recognize changing sound environments and select user-preferred hearing programs—for example, moving from a quiet room into a busy restaurant. Users can associate environments with programs, set cooldown delays to avoid rapid switching, and retain the option to override automatic selections.

Help in Noisy Environments

Speech can be difficult to follow when background noise rises. HeySig aims to recognize these conditions and select a hearing program already configured for that situation. It does not replace the hearing aids' built-in speech processing or noise reduction.

Hands-Free Voice Commands

Instead of opening menus, users can request common changes by speaking to their Android phone or compatible watch. The intended experience includes commands for volume, listening programs, automatic mode, and supported tinnitus controls.

- **Volume:** “Increase volume” or “Lower volume.”
- **Programs:** “Restaurant mode,” “TV mode,” “Outdoor mode,” or “Universal mode.”
- **Automation:** Voice requests to enable or pause automatic program selection.
- **Tinnitus:** Voice access to supported tinnitus therapy controls where available.

These phrases illustrate intended interactions; actual supported commands vary by version. Voice recognition runs on the phone or watch, not in the hearing aids.

Tinnitus Therapy Scheduling

For compatible Signia hearing aids with tinnitus therapy already activated, HeySig is designed to schedule therapy at user-selected times. This reduces the need to remember manual changes while preserving the therapy settings established by a hearing care professional. HeySig does not unlock unavailable tinnitus features.

More Ways HeySig Makes Hearing Easier

- **Volume and balance:** Quick access to volume and left/right balance adjustments where the devices and app support them.
- **Favorite settings:** One-touch access to preferred programs and volume levels.
- **Manual override:** Temporarily select a listening program without immediate automatic switching.
- **Smartwatch access:** Make common changes from the wrist instead of reaching for the phone.
- **Phone gestures:** Optional shake-based shortcuts for convenient control.
- **Battery-conscious operation:** Monitoring strategies intended to minimize unnecessary phone and watch battery use.
- **Acoustic command feedback:** Clear status messages distinguishing commands sent from changes actually verified.

Designed for an Easy, Friendly Experience

HeySig emphasizes intuitive navigation, straightforward controls, and integrated instructions. In-app guidance helps users set up features, learn voice commands, choose listening programs, and configure tinnitus schedules without hunting through separate manuals.

Additional accessibility and onboarding ideas include large buttons, readable text, clear contrast, optional spoken feedback, and a first-time setup assistant.

Personalization and Future Possibilities

- **Custom voice phrases:** Choose memorable commands for frequently used programs.
- **Listening history:** Review which programs were selected and when.
- **Personal routines:** Apply preferred settings for regular activities or times of day.
- **Quick-access shortcuts:** Reach common controls without opening the full app.

Small Hearing Aids, Without the Usual Compromises

HeySig aims to deliver some of the convenience associated with connected hearing aids while keeping compatible acoustic-communication devices small and discreet. It builds on existing hearing aid capabilities rather than changing their internal sound processing or replacing audiologist programming.

The Bottom Line

You shouldn't have to choose between small, comfortable hearing aids and convenient modern controls. HeySig brings together automation, voice interaction, watch access, tinnitus scheduling, and easy-to-follow guidance to help users make more of the hearing aids they already own.

Keep your hearing aids small. Let your phone and watch do the thinking.
